TECHNICAL PROJECT REPORT

Project: Restaurant POS & Billing System Dashboard

Developer Name:	Pankaj
Development Timeline:	1 Day (Scratch to Deployment)
Deployment Status:	100% Live & Operational
Production Link:	https://technocart-bm.vercel.app

1. Core Problem Statement & Objectives

Ek single day execution window ke andar restaurant handling workflow ko complete simplify karne ke liye ek robust dynamic billing solution implement karna mandatory tha. Core target vectors is project me clear the: Fast reactive menu lookup, flexible multi-table queue buffer cart design, real-time background active tracker mechanism, aur strict 5% GST mathematical billing invoice output print layout template modal setup.

2. Architecture & Computational Flow

System core state-driven lifecycle methodology utilize karta hai: Waiter menu grids se items directly target allocations dropdown ke through trigger karte hain. Input signals dynamic arrays state layers ko update karti hain, jisse absolute linear pipeline processing secure hoti hai: **Menu List View -> Reactive Table Workspace -> Active Orders Queue Buffer -> Tax-Calculated Invoices Modal.**

3. Implementation Decisions & Technology Matrix

React.js (Vite Toolchain Deployment framework) chuna gaya real-time rapid continuous optimization data rendering pipelines secure karne ke liye. Layout architecture completely structural embedded style objects standard inline templates framework execute karta hai, jisse dynamic v4 global variables conflicts zero compile crash matrix trigger karein.

4. Deployment Strategy & Diagnostics Execution

Cloud push operation local workspace nodes configuration settings verification pipeline chain ke upar resolve kiya gaya. Vite configuration transform processing nodes diagnostic locks aur syntax structural mismatch exceptions line blocks map vectors completely optimize kar diye gaye, jisse continuous edge deployment node infrastructure automatically parameters live store lookup load framework trigger kare.

5. Future Scope Framework Roadmap

1. Offline Database synchronization architectures structure indexing logic layer standard implementations setup via SQLite.
2. Kitchen Display Module multi-screen configurations dynamic real-time status monitor flow matrix updates handling system for back-end chefs.
3. Visual dashboard modules analytic reports tracking indicators, conversion analytics layout, and gross processing items turnovers metric tracking charts.
